

Lab 3: Building Linux Kernel and Controlling an I²C Device

Due Date: See the course schedule web page.

Objectives:

- Understand I²C bus protocol
- Be able to control an I²C device using Linux on a Galileo board
- Be able to capture, store and process camera images on Linux

Description:

You should now have a working sensor device interfaced with the Galileo development board via GPIO ports. We would like to add a couple of new devices to the system so that your embedded system has richer functions. The devices are as follows:

- (1) A temperature sensor (TMP102). This is an I²C device that measures ambient temperature to a resolution of 0.0625°C. The IC is provided on a breakout board for easy connection. Its details can be found in [3].
- (2) A USB webcam to capture images and videos

This lab consists of three objectives:

- (1) programming I²C devices from Linux. You will use the same Galileo Linux image as Lab 2 to boot and operate your Galileo board in order to program the I²C devices using Linux I²C libraries and APIs.
- (2) use temperature sensor to trigger the capture of images from webcam. You need to define a threshold and check if the sensor data exceed the threshold. If so, capture images and save them to the file system.
- (3) programming on Linux to access and handle the provided webcam and capture images. Store the images on the SD card and prepare for further processing (in lab 4).

Connecting I²C devices to Galileo

Refer to datasheets for the schematic. Your I²C devices should be connected to A4 (SDA) and A5 (SCL) of Galileo's expansion I/O ports. For Galileo Gen 2 "gpio60" is the MUX GPIO that should be LOW.

(Refer to the Galileo Gen2 Linux GPIO pin map: <https://communities.intel.com/thread/55920>).

You do not have to wire the pull-up resistors for the I²C bus since the breakout boards already have them.

Programming I²C Devices from Linux

Linux has mature I²C drivers and libraries for programming I2C devices. Please refer to the official documentation on I2C development:

<https://www.kernel.org/doc/Documentation/i2c/dev-interface>

There are also other related tutorials, for example:

<http://blog.chrysocome.net/2013/03/programming-i2c.html>

Programming webcam and connecting Wifi on Linux

Instructions are given in a text file as a part of the github repo:

<https://github.com/yanluo-uml/micro2/>

You need to use git command to make a copy of the repository:

```
git clone https://github.com/yanluo-uml/micro2/
```

Deliverables

A zipped file containing:

1. Schematic of the design (in both native and pdf formats)
2. Source code (for Galileo Linux)
3. Lab Reports in PDF format (All the team members' Lab Reports)

Zip file should have the following format: "GroupXX_LAB3.zip"

(XX is the group number, for more details see at the posted rules for deliverables on Piazza)
